POLICY
The informed consent process will be conducted in compliance with all regulations, guidelines and policies applicable to the protection of human subjects. A written informed consent document containing all the required elements must be used to document the subject’s agreement to participate in the research study, unless the IRB had approved an alteration or waiver of such document. The IRB-approved consent document must not be altered in ANY way with handwritten notes or marking, except as described in Step 5 below.

The informed consent process must be documented in the medical record by the Principal Investigator or designee to establish that the subject was accurately and adequately informed, that no study-related procedures were initiated prior to obtaining informed consent, and that a copy of the informed consent document was given to the subject. The original consent should be sent to the medical record department, where it will be scanned into the subject’s medical record. Documentation of the informed consent process must be completed in the medical records within 72 hours of the informed consent document being signed.

The research protocol must specify the use of the following special consent circumstances, if applicable:

- Use of short form consent for non-English speaking subjects
- Use of a telephone consent process
- Enrollment of minor subjects, including assent from the minor subjects
- Enrollment of adults unable to consent, including assent of subjects
- Enrollment of NIH employees

BACKGROUND
The conduct of clinical research studies, including clinical trials, is based upon the voluntary consent of the subject who has been appropriately informed about a study’s risk and benefits. The ethical principle of respect for persons requires that subjects be given the opportunity to choose whether or not to participate in research.

Three elements are required for valid informed consent:

- Disclosure of relevant information to prospective subjects about the research
- Prospective subjects’ comprehension of the information
- Prospective subjects’ voluntary agreement, free of coercion and undue influence, to research participation.
Consent is an ongoing process. It starts well before any forms are signed and continues until the subject has completed participation. The informed consent process involves meeting with the potential subject, outlining the nature of the study, the risks and benefits of participating, alternatives to participation, and all other information necessary for the subject to make an informed decision whether or not to participate. The consent form formalizes the subject’s agreement to participate in the research study.

**DEFINITIONS**

**Informed Consent:** A process by which a subject voluntarily confirms his or her willingness to participate in a particular clinical research protocol, after having been informed of all aspects of the trial that are relevant to the subject’s decision to participate. Informed consent is documented by means of a written, signed, and dated informed consent form. The informed consent process must be documented in the medical record.

**Subject:** An individual who is or becomes a participant in research, including a recipient of the test article or a control. A subject may be either a healthy volunteer or a patient.

**Legally Authorized Representative (LAR):** An individual or judicial or other body authorized under applicable law to consent on behalf of a prospective subject to the subject’s participation in the clinical trial.

**Adult:** Anyone 18 years of age or older. For purposes of providing consent, a minor who is married, a parent, or an emancipated minor may also be considered an adult.

**Assent:** A child’s affirmative agreement to participate in a clinical investigation. Assent may also be obtained from an adult deemed unable to provide informed consent for whom an LAR has provided written informed consent.

**PURPOSE**

To describe activities involved with obtaining and documenting the informed consent process for the study subject in the Center for Cancer Research (CCR), National Cancer Institute (NCI).

**PROCEDURES**

**Step 1: Obtain most current approved consent document**

- Obtain the current IRB approved version of the protocol’s consent document from NIH Clinical Research Studies Active Consent/Assent Documents website.
- Make sure all pages of consent document are present, legible and in order.
- Check approval date and version to assure most current approved version. This is located on the first page of the informed consent document.
  - If not the current version, contact the IRB Administrative Office via email (nciirbadmin@mail.nih.gov) to investigate the possible discrepancy.

**Note:** When the IRB approves a protocol amendment or continuing review, a new informed consent version is generated. If the IRB has approved an amendment or continuing review and the new version of the informed consent document is not yet available on the Clinical Center’s website, contact the IRB Administrative Office via email (nciirbadmin@mail.nih.gov) to request the currently-approved consent.
Step 2: Determine who will be involved in the consent process
- The Principal Investigator, an Associate Investigator or other designated individual identified in the protocol must obtain informed consent. The investigator obtaining consent is responsible for assessing that:
  - the study subject is capable of making an informed decision (i.e., having the capacity to consent for oneself at the time of the informed consent discussion);
  - the study subject understands the information provided; and
  - the study subject’s consent is voluntary and free of any undue influence or coercion.
- For research involving adults who are unable to provide consent or for study subjects under 18 years of age, consent must be obtained from a legally authorized representative (LAR).
  - Individuals designated on NIH-200 Advance Directive or other valid advance directive, or court-appointed guardians are acceptable as LARs.
  - For study subjects with limited capacity to consent, HRPP SOP 14E and MAS policy M87-4 must be followed.
- Ensure that a witness is available to observe signing of the consent document.

Step 3: Initiate informed consent process
- Give study subject or LAR most current version of consent document.
- Allow study subject or LAR time to read the consent document.
- Discuss issues related to the essential elements of an informed consent:
  - Discuss the research study including procedures, treatment plan, potential risks, benefits of participation, study subject’s rights as a participant, and alternatives to participation in the research study.
  
  Note: Discussions about protocol treatment and alternatives to participation must be carried out by an appropriately licensed provider (i.e., MD, DO, NP, PA).
- Ask study subject or LAR if he/she has any questions.
  - All questions about the trial should be answered to the satisfaction of the study subject or LAR.
- When the study subject or LAR has no questions and is ready and willing to consent to participate in the clinical trial, he/she documents such by signing and dating the informed consent document on the signature page where specified. If the informed consent document contains any embedded questions, the subject must answer these as required.
- If the study subject declines to sign the consent, document reason in the medical record. DO NOT perform any research procedures on a subject that declines to sign the consent document.
  
  Note: Per MAS policy, the informed consent document must include the subject’s name and medical record number in the lower left corner of each page of the form.

Step 4: Obtain other signatures required on consent document
- After the study subject or LAR has signed and dated the consent document, the witness signs and dates the consent document.
  - The witness is attesting only that the study subject or LAR signed the document.
- The investigator (Principal Investigator, Associate Investigator or designed individual) who obtained consent signs and dates the consent document at the time of consent.

**Step 5: If appropriate, follow consent process for non-English speaking research subjects.**

- **Expected enrollment** of non-English speaking subjects will require an IRB-approved translated consent document.
  - A copy of the IRB-approved translated consent document is given to the subject.
- **Unexpected enrollment** of non-English speaking subjects requires the use the short form consent.
  - Ensure that the current protocol allows for enrollment of non-English speaking subjects and that the IRB has prospectively approved the use of the short form consent. See Appendix A if the IRB has not prospectively approved the use of the short form consent.
  - “Short form” consent documents for commonly spoken languages are available on the Clinical Center website.
  - **Note:** Be sure that you choose the version of the short form consent that has the FDAAA language that is consistent with the written English consent document.
  - Give a copy of the short form in the subject’s preferred language to the subject to review.
- Discuss the research study (as described in Step 3 above) utilizing an interpreter, preferably independent from the study subject, to facilitate discussion.
  - Prearrangements may be made via the Social Work Department to secure an interpreter.
  - The interpreter may act as witness to consent and sign documents as below. The interpreter must note “Interpreter” under his/her signature line(s) per HRPP SOP 12.
- **Signatures required for translated long form:**
  - The study subject or LAR signs and dates the translated consent document.
  - A witness to the subject’s or LAR’s signature signs and dates the translated consent.
  - The investigator obtaining consent signs and dates the translated consent.
- **Signatures required for short form in subject’s preferred language and English consent document:**
  - The study subject or LAR signs and dates the short form.
  - A witness to the entire oral presentation signs and dates both the short form and the English consent document.
  - The investigator obtaining consent signs and dates the English consent document.
- **Also,** complete the NIH Administrative Section on the signature page of the short form to indicate if an interpreter was used during the short-form informed consent process.

**Step 6: If appropriate, obtain assent from child subject. Review HRPP SOP 14D and MAS policy M92-5**

- Follow the IRB-approved procedures specified in the protocol to obtain parental/LAR consent (e.g. whether one parent’s signature is sufficient given the level of risk).
  - Per HRPP SOP 14 D “In cases where parents share joint legal custody for medical decision-making of a child (e.g., by a custody agreement or court order), both
parents must give their permission regardless of the risk level of the research.”
(14D.6.1 Obtaining or Waiving Parental Permission)

- The signature page of the informed consent document has a single line for the parental signature. If two signature are required, please have both signature on line or as close to the signature line as possible.
- If the IRB determines that the child’s assent is needed, follow protocol-specified procedures for obtaining assent.
- The protocol should be explained to the child in an age appropriate way that allows the child to provide a meaningful, informed assent. Explanation should include the following:
  - The reason for being at the research facility.
  - Expectations of what a child will experience in the hospital.
  - Description of procedures and immediate consequences of the procedures.
  - Explanation of reason for the study and the benefits to the child or other children.
- When minors reach the age of 18, they MUST be consented to the study using the standard consent document as parental/LAR consent is no longer valid after the subject becomes as adult. Even if a study is in data analysis only at the time the minor reaches 18, the investigators are still using identifiable specimens and data and the now-adult subject must be consented. Refer to the study protocol for more information about consenting minors when they reach the age of 18.

**Step 7: If appropriate, follow oral consent process (for illiterate or blind research subjects).**
- The oral consent process requires the use of 2 forms, reviewed and approved by the IRB: a written summary (ordinarily the existing IRB-approved consent document) and a short written consent document (“short form”).
  - English “short form” consent documents are available on the Clinical Center website.
  - **Note:** Be sure that you choose the version of the short form consent that has the FDAAA language that is consistent with the long form consent document.
- The study should be presented verbally to the subject (as described in Step 3 above). The witness to the consent process must also witness the oral presentation.
- The study subject or LAR signs and dates the short form.
- A witness to the entire oral presentation signs and dates both the short form and the long form.
- The investigator obtaining consent signs and dates the long form.
- Whenever possible, information in the documents should be provided to the subject in a way that he/she can review and understand (e.g. tape recording, Braille document). This additional information must be approved by the IRB prior to use.

**Step 8: File the original, signed consent document in the study subject’s medical record.**
- Make 2 copies of all pages of the signed and dated consent/assent document.
  - Send the original signed, dated consent/assent document(s) to Medical Records Department for scanning into the study subject’s medical record.
  - Give the study subject or LAR a copy of the signed consent/assent document. If the subject declines a copy, please document in the medical record.
Maintain a copy of the signed informed consent in the subject’s research record until the scanned version is available in the subject’s medical record. Once the scanned version is available and verified, the copy may be destroyed.

Medical records will send all original signed consents to the OCD who will distribute to the appropriate research nurse. If the study sponsor requires the original to be maintained then this is placed in the subject’s research record; otherwise, this may be destroyed as per Clinical Center medical record policy.

Step 9: Document the consent process in the study subject’s medical record.

- Good clinical practice supports documenting the consent process in the study subject’s medical record. The CRIS “Documentation of Informed Consent” progress note should be used. The note must be completed within 72 hours of the consent document being signed but someone that was present during the informed consent process - the note does not have be to be completed by the investigator obtaining consent.
- At a minimum, the following should be included:
  - Protocol number and/or short title
  - Date consent was obtained.
  - The study was discussed and questions were answered.
  - A copy of the consent/assent document was provided to the study subject or LAR.
  - The consent was obtained prior to any research procedures being performed.
  - If applicable, oral consent or consent of non-English speaking subject was performed. In these cases, include name of interpreter, if used.
  - Assent process used for minor subject, as required.

Step 10: Continue informed consent process throughout duration of study participation.

- Principal Investigator or designee should contact all study subjects on study and inform them of any new findings, as appropriate, and determine their willingness to continue treatment/participation on the study based upon the new information.
- The study subject or LAR must be informed of a change in protocol procedures that will affect the subject or a change in risk information, such as a newly documented adverse effect. The requirement to obtain the subject’s or LAR’s signature on an updated informed consent document (i.e., re-consent) is determined by the protocol sponsor and IRB.
  - The discussion of the new information may be initiated by having the study subject sign an IRB-approved revised consent document, by signing an IRB-approved information disclosure document, or by another mechanism; as determined and approved by the IRB.
  - The same consent procedures outlined above will be followed for re-consenting a study subject or LAR.
  - When an IRB-approved information disclosure document or another disclosure mechanism is used, the document used and the notification process must be included in the medical record (see #9 above).
  - In the case of an emergency (i.e. study subjects must immediately stop study treatment), contact the NCI IRB Chairperson for instructions.
  - If study subject declines to continue, follow withdrawal procedures.
• Principal Investigator or designee must document the discussion with the study subject regarding the new findings and the study subject’s decision whether or not to continue the study in a progress note in the medical record.

STEP 11: **If appropriate and the protocol allows, obtain initial consent or re-consent via telephone.**

• Initial consent: Contact the potential study subject or LAR and explain that the protocol consent document will be sent for review.
  o Example: Before actually coming to campus a potential study subject must send biopsy to NIH for verification of diagnosis.

• Re-consent for subjects not returning to the Clinical Center (CC): Contact the study subject or LAR and explain the need for an additional consent.
  o Example: if teams want to do additional testing on a research specimen that was already collected and the subject is not returning to the CC.
  o Example: New potential risk identified and the IRB requires re-consent prior to the subject returning to the CC.

• Send approved copy of the consent to the study subject for review and set up a time to review the consent with the subject. Inform the potential subject that he/she will need to have someone available to witness the signature at the time the document is signed.
  o Include a postage paid return envelope with the consent for the subject to use to mail the consent back, unless the subject will fax the signed document or send via secure email – see Note below.
  o Review consent information via telephone with subject and ensure that a witness is available at the same location as the subject to witness the subject sign the document.
  o If the study subject is a minor and the protocol requires assent of the minor, the minor must be present on the telephone during the informed consent and assent process.
  o If using the short form process, the witness to the oral presentation must sign both the short form and English long form. In this case, a member of the research team/other NIH staff that is present for the entire oral presentation may sign as the witness on both forms.

• Once the required signature(s) have been obtained, the subject returns the signed document to the person obtaining consent, via fax, secure email or mail.

• When the original consent (or faxed version) arrives at the CC, the investigator obtaining consent signs the document and dates the signature with the date of the telephone conversation.

  **Note:** If the study subject faxes the signed consent document to the person obtaining consent, the fax becomes the “original” once the person obtaining consent signs the document. There is no need for the subject to mail the original.

• Document the telephone process in the subject’s medical record, including the date of receipt of signed informed consent.

• Send a copy of the fully signed consent document to the subject.

  **Note:** Email communication that may contain personally identifiable information (e.g., subject’s and witness’s names and signatures on the signature page) **MUST** be sent via secure email.
Important: “Verbal” consent is not allowed unless the protocol specifies that verbal consent will be used and the IRB approves the process. Obtaining written consent via telephone is NOT “verbal” consent and the subject is not considered consented to the study until the signed informed consent document is received by the person obtaining consent via telephone. No research procedures may be performed, including verifying a diagnosis, until the informed consent document signed by the subject and appropriately witnessed is received in the Clinical Center, via fax, secure email or mail.
Appendix A

If the IRB has not prospectively approved the use of the short form for non-English speaking subjects, the research team must request IRB approval to use the short form consent process. The following should be submitted to IRB using the short form application in iRIS:

- A written summary, in English, (usually the existing IRB-approved informed consent document).
- A Short Written Consent Form ("Short Form") in the subject’s native language.
  - “Short form” consent documents for commonly spoken languages are available on the Clinical Center website. Note: Be sure that you choose the version of the short form consent that has the FDAAA language that is consistent with your written English consent document.
  - If you need to use the short form addendum for other language(s) not available on the website, please submit the English version for translation through the NIH Translation Office in the NIH Library using the Translations Request form. Once translated, the above steps can then be followed.
  - Include the Certificate of Translation for a newly translated short form addendum.
- When you receive back the IRB approval to use the short form consent process, save the approval in your regulatory file.
