AGE:	36 Y	SIGN-OUT DATE:	06/04/04
SEX:	M	LOCATION:	OUTPATIENT 12
ATTENDING:	BARRY GAUSE	ROOM:	
REQUESTING:	BARRY GAUSE		
CONTACT NO:	(MD) -		
COPIES TO:			

SUPPLEMENTAL REPORT

REASON FOR SUPPLEMENTAL REPORT: The reason for this supplemental report is to report the findings of additional immunohistochemical studies that were performed, the diagnosis remains unchanged.

Immunohistochemical studies were performed and the neoplastic cells, which are confined to follicles, are positive for CD20 and Bcl-2 with a low proliferative index as per MIB-1 and negative for CD3.

The immunoperoxidase tests performed here were developed and their performance characteristics determined by the Specialized Diagnostics Unit of the Laboratory of Pathology, NCI. They have not been cleared or approved by the U.S. Food and Drug Administration. The FDA has also determined that such clearance or approval is not necessary. This laboratory is certified under the Clinical Laboratory Improvement Amendments of 1988 (CLIA) as qualified to perform high complexity clinical laboratory testing.

DIAGNOSIS: Lymph node, left scalene (excisional biopsy,XXXXXXX, A4 and): Follicular lymphoma, grade 1 of 3, see Note.

NOTE: The follicles are sharply defined and have well preserved lymphoid cuffs. These features cause resemblance to follicular hyperplasia. However, the follicles extend into the surrounding adipose tissue. In addition, immunohistochemistry studies were performed at the National Naval Medical Center, and were said to be characteristic of follicular lymphoma. The lymphocytes in the nodules were reportedly strongly positive for CD20, CD10 and bcl-2, and appeared to be kappa light chain restricted. The cells were negative for CD3 and CD5. These slides were unavailable for our review.

CLINICAL INFORMATION: 36-year-old male diagnosed with follicular lymphoma from left neck biopsy in 11/19/99. The patient has been followed by CT scans every six months; progression of abdominal disease (2/2004).
