

## Other Discovery Tools

The MTP welcomes opportunities to assist in the development or application of other pertinent discovery tools, which might include more specialized bioassays, screens, reagents or related technology of interest to CCR investigators. The MTP is eager to collaborate in the evaluation or implementation of a broad range of available or evolving "discovery" and validation technologies, including proprietary methods, hardware, software, compounds or collections, from the private-sector. In so doing, the MTP intends to enhance the CCR's intramural capabilities for follow-up investigations of screening hits, bioprobe or drug-lead discovery and characterization, identification and validation of new molecular targets, and other pertinent research supporting preclinical or clinical advancement of molecular therapeutics, diagnostics and imaging.
